UPOZORNENIE

estimated from the first 1000 iterations of the MCMC algorithm to avoid any influence from the starting values. The mean and standard deviation of the posterior distribution of the parameters were estimated from the remaining 1000 iterations. The 95% credible interval (CrI) was estimated from the 2.5th and 97.5th percentiles of the posterior distribution. The model was fitted using the JAGS 4.3.0 software package (Ihaka and Gentleman, 1996; John et al., 2009) via the R 3.1.1 interface (R Core Team, 2013). The model was fitted to the data from the 1000 patients with the most complete information on the variables of interest. The model was fitted to the data from the 1000 patients with the most complete information on the variables of interest. The model was fitted to the data from the 1000 patients with the most complete information on the variables of interest.
