Sterillium as a preparation for hygienic handrub

Expert Opinion

In accordance to your request dated 01.04.2016, we tested your preparation **Sterillium** (test sample VP 83/3W) as a product for hygienic handrub according to EN 1500 (date July 2013). The results are presented in the enclosed test reports 2016-102 and 2016-104.

1. Results of the in-vitro-tests

As suitable combination of neutralization substances we determined 3 % polysorbate, 3 % saponine, 0,1 % histidine, 0,1 % cysteine.

Sterillium meets the requirements of the quantitative suspension test under dirty conditions relating to VAH (2015) (test report 2016-102).

2. Results under simulated practical conditions according to EN 1500

The results under simulated practical conditions showed (test report 2016-104) that **Sterillium** is proved suitable for hygienic handrub according to EN 1500 (2013). The mean of the log reduction of all 20 volunteers is higher than the reference procedure.

3. Evaluation

Sterillium is suitable for hygienic handrub and meets all requirements relating to EN 1500.

4. Recommendation for use

3 ml **Sterillium** rubbed in to dry hands during 30 seconds.
